

## AI Enablement for Procurement & Commercial Functions

### Practical AI adoption that reduces manual effort and supports better decision-making

The range of AI tools available to procurement and commercial teams is growing at an unprecedented pace. From sourcing and contract analytics to supplier risk and spend insights, the opportunity is significant — but so is the confusion. Selecting the *right* AI tools, in the *right* order, and for the *right* use cases is not straightforward. FlexProc helps organisations cut through the noise, assess their current maturity, and adopt AI tools in a way that delivers tangible benefits — increased automation, reduced manual workload, and better commercial outcomes

### Our Approach

FlexProc takes a practical, vendor-independent approach to AI enablement, focused on solving real problems rather than implementing technology for its own sake. We work collaboratively with in-house teams to ensure recommendations are realistic, prioritised, and aligned to existing processes and capabilities

### What We Do

1. Functional Maturity Assessment – We assess your current procurement or commercial maturity across people, processes, data, and technology to understand where AI can genuinely add value today
2. Use Case Identification – We identify high-impact, low-regret AI use cases — targeting areas with heavy manual effort, fragmented data, or repetitive tasks
3. Tool Landscape Review – We review relevant AI tools and platforms aligned to your needs, avoiding unnecessary complexity or duplication with existing systems
4. Prioritised Adoption Roadmap – We develop a clear, phased roadmap that sequences AI adoption based on value, readiness, and risk
5. Practical Implementation Support – Where required, we support early adoption — helping teams embed AI tools into day-to-day workflows rather than treating them as standalone solutions

### What This Delivers

- Reduced manual and low-value tasks
- Increased automation across core procurement activities
- Better use of existing data
- Improved efficiency without large-scale transformation
- Clear, defensible AI investment decisions
